

Portfolio (Build)

What Was Built

This portfolio presents selected academic projects, focusing on what was built. It emphasises system structure, implementation depth, and functional delivery, rather than outcomes alone.

Name: Kiran

Program: B.Tech Computer Science & Engineering

University: BML Munjal University

Project 1: Skin Disease Detection System

Problem Context

Accurately diagnosing skin diseases can be challenging and time-consuming without immediate access to specialized medical expertise or dermatologists.

System Built

Developed an ML-based image classification system to detect skin diseases using medical images.

Implementation Details

- Applied image preprocessing techniques to prepare and standardize medical images for analysis.
- Trained a Convolutional Neural Network (CNN) model to ensure accurate disease classification.

Technology Stack

Python, CNN, NumPy, Pandas, OpenCV

Project 2: US–India Stock Market Relationship Analysis

Problem Context

Understanding the complex correlations and economic impacts between distinct global markets, specifically the US and India, requires deep analysis of voluminous historical data.

System Built

A data analysis project that examines historical US and Indian stock market data to evaluate correlation and mutual market impact.

Implementation Details

- Analyzed historical stock market datasets from both the US and Indian markets.
- Utilized data analysis techniques to study market correlations and subsequent impacts.
- Visualized complex market trends and relationships for easier interpretation.

Technology Stack

Python, Pandas, NumPy, Matplotlib
